

**Machine Learning** 

# Linear regression with one variable

# Model representation

### **Supervised Learning**

Given the "right answer" for each example in the data.

### Regression Problem

Predict real-valued output

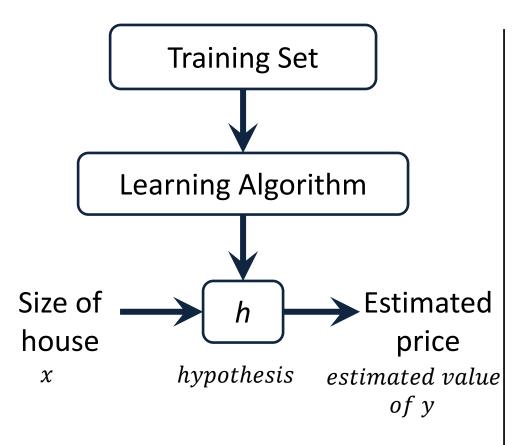

<b>Training set of</b>	Size in feet <sup>2</sup> (x)	Price (\$) in 1000's (y)
housing prices	2104	460
(Portland, OR)	1416	232
( or	1534	315
	852	178

#### **Notation:**

```
m = Number of training examples
```

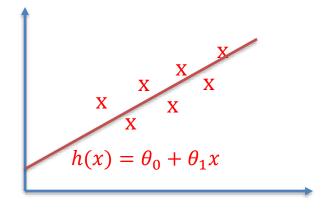

x's = "input" variable / features

y's = "output" variable / "target" variable

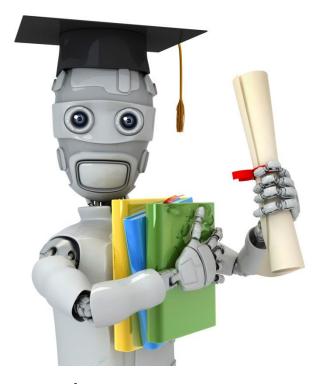

#### How do we represent *h* ?

$$h_{\theta}(x) = \theta_0 + \theta_1 x$$

Linear regression with one variable. Univariate linear regression.

Machine Learning

# Linear regression with one variable

## Cost function

## **Training Set**

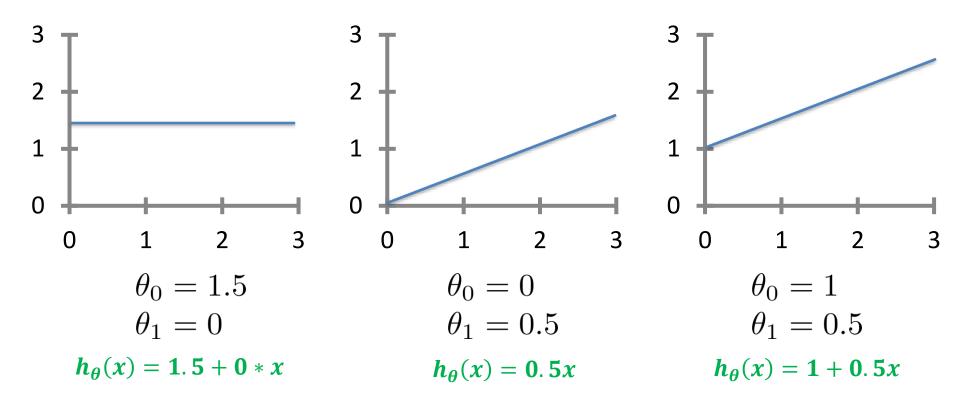

Size in feet <sup>2</sup>	(x) Price (\$) in 1000's (y)
2104	460
1416	232
1534	315

Hypothesis: 
$$h_{\theta}(x) = \theta_0 + \theta_1 x$$

 $\theta_i$ 's: Parameters

How to choose  $\theta_i$ 's ?

$$h_{\theta}(x) = \theta_0 + \theta_1 x$$

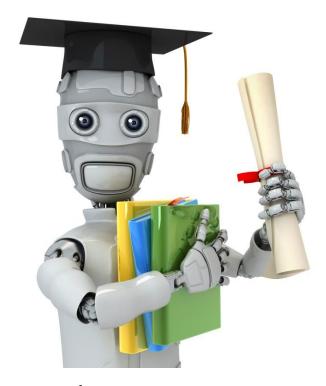

$$\begin{aligned} & \underset{\theta_0, \, \theta_1}{minimize} & \frac{1}{2m} \sum_{i=1}^{m} \left( h_{\theta}(x^{(i)}) - y^{(i)} \right)^2 \\ & h_{\theta}(x^{(i)}) = \theta_0 + \theta_1 x^{(i)} \end{aligned}$$

Idea: Choose 
$$\theta_0, \theta_1$$
 so that  $h_{\theta}(x)$  is close to  $y$  for our training examples  $(x,y)$ 

$$J(\theta_0, \theta_1) = \frac{1}{2m} \sum_{i=1}^{m} (h_{\theta}(x^{(i)}) - y^{(i)})^2$$

$$minimize \quad J(\theta_0, \theta_1)$$

$$\theta_0, \theta_1 \quad cost function$$

Machine Learning

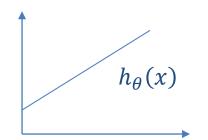

# Linear regression with one variable

# Cost function intuition I

## Hypothesis:

$$h_{\theta}(x) = \theta_0 + \theta_1 x$$

$$\theta_0, \theta_1$$

#### **Cost Function:**

$$J(\theta_0, \theta_1) = \frac{1}{2m} \sum_{i=1}^{m} (h_{\theta}(x^{(i)}) - y^{(i)})^2$$

Goal: minimize  $J(\theta_0, \theta_1)$ 

### <u>Simplified</u>

$$h_{\theta}(x) = \theta_1 x$$

$$(\theta_0 = 0)$$

$$\theta_1$$

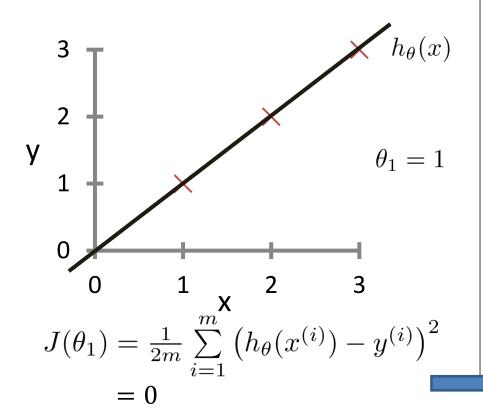

$$J(\theta_1) = \frac{1}{2m} \sum_{i=1}^{m} \left( h_{\theta}(x^{(i)}) - y^{(i)} \right)^2$$

$$\underset{\theta_1}{\text{minimize}} J(\theta_1)$$

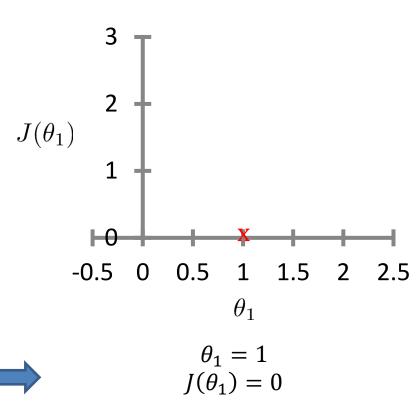

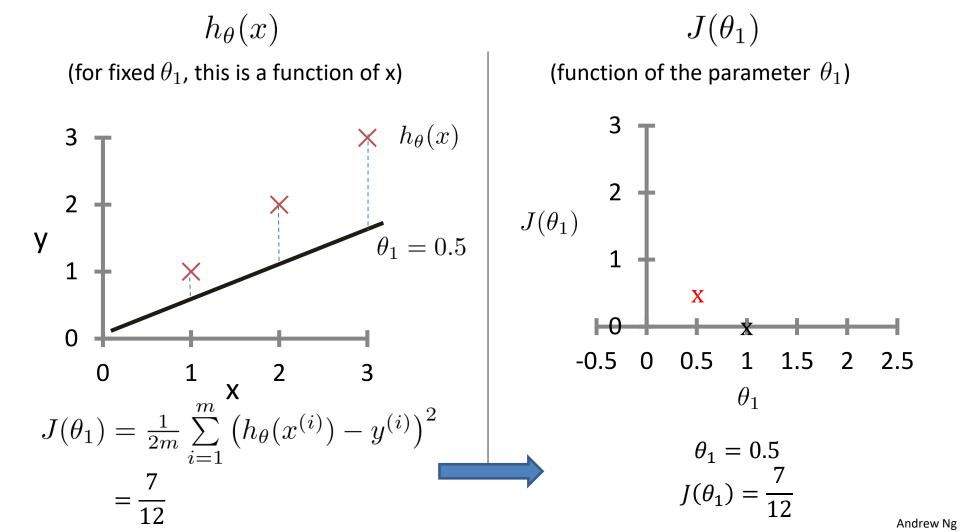

(for fixed  $\theta_1$ , this is a function of x)

 $J(\theta_1)$ 

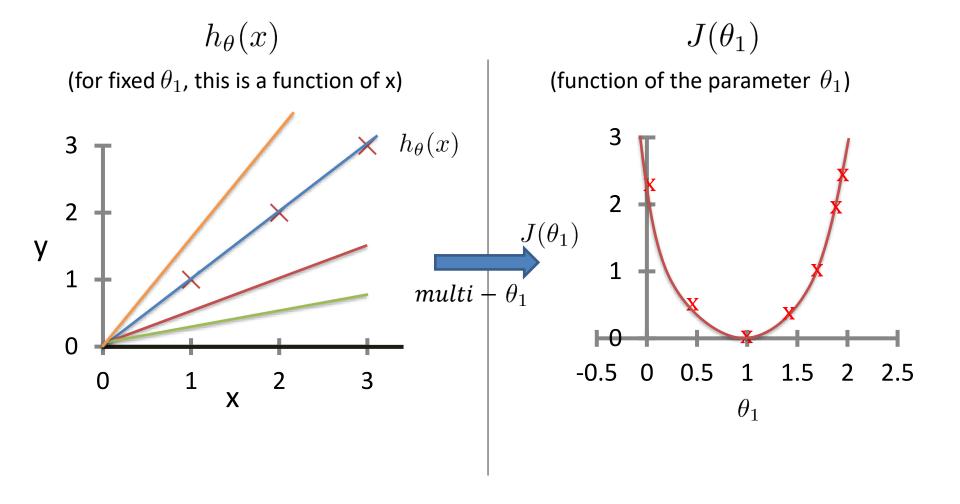

(function of the parameter  $\theta_1$ )

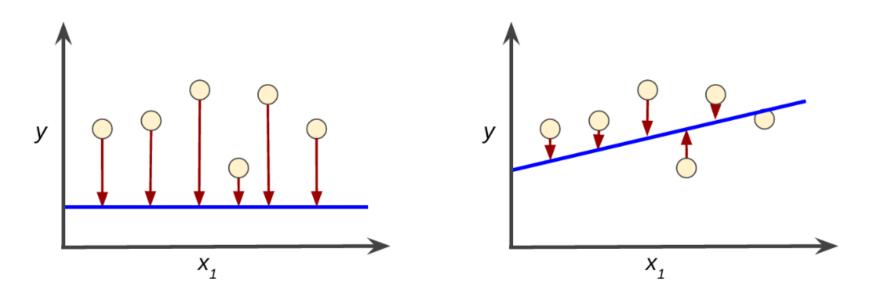

$$h_{\theta}(x)$$
 (for fixed  $\theta_1$ , this is a function of x) 
$$\begin{array}{c} J(\theta_1) \\ \\ \\ J(\theta_1) \\ \\ J(\theta_1) \\ \\ J(\theta_1) \\ \\ \\ J(\theta_1) \\ \\ \\ J(\theta_1) \\ \\ \\ J(\theta_1)$$

Andrew Ng

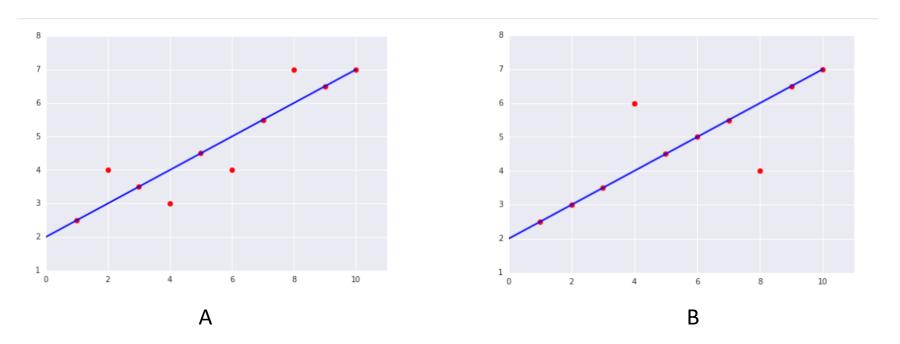

- The arrows represent loss.
- The blue lines represent predictions.

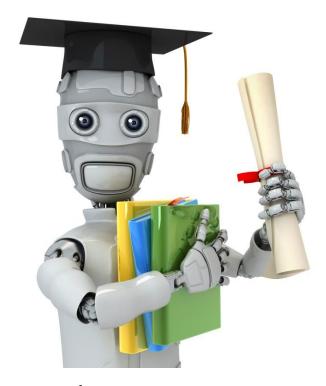

High loss in the left model; low loss in the right model.

#### Consider the following two plots:

Which of the two data sets shown in the plots has the lower loss?

Machine Learning

# Linear regression with one variable

# Cost function intuition II

Hypothesis: 
$$h_{\theta}(x) = \theta_0 + \theta_1 x$$

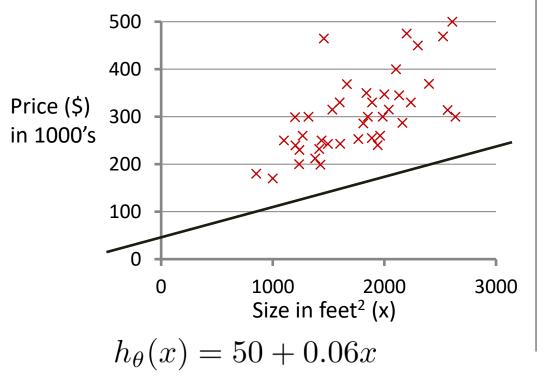

Parameters: 
$$\theta_0, \theta_1$$

Cost Function: 
$$J(\theta_0, \theta_1) = \frac{1}{2m} \sum_{i=1}^{m} (h_{\theta}(x^{(i)}) - y^{(i)})^2$$

Goal: 
$$\min_{\theta_0,\theta_1} \text{minimize } J(\theta_0,\theta_1)$$

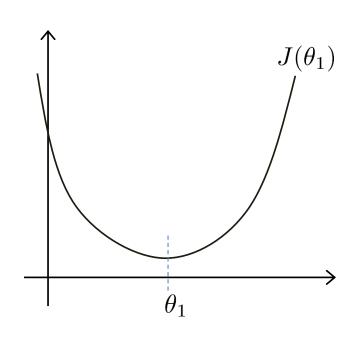

### $h_{\theta}(x)$

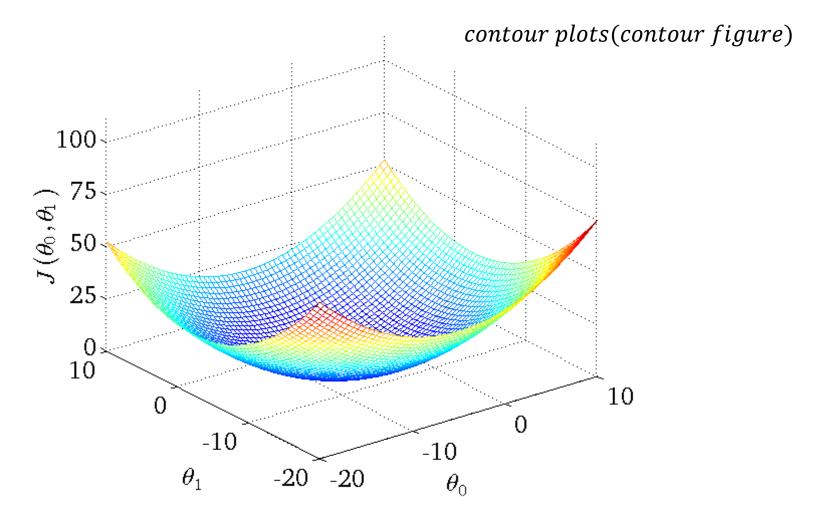

(for fixed  $\theta_0$ ,  $\theta_1$ , this is a function of x)

 $J(\theta_0,\theta_1)$ 

(function of the parameters  $heta_0, heta_1$ )

 $J(\theta_0, \theta_1)$ 

(function of the parameters  $heta_0, heta_1$ )

 $J(\theta_0, \theta_1)$ 

(function of the parameters  $\theta_0, \theta_1$ )

 $J(\theta_0, \theta_1)$ 

(function of the parameters  $\theta_0, \theta_1$ )

 $J(\theta_0, \theta_1)$ 

(function of the parameters  $\theta_0, \theta_1$ )

Machine Learning

# Linear regression with one variable

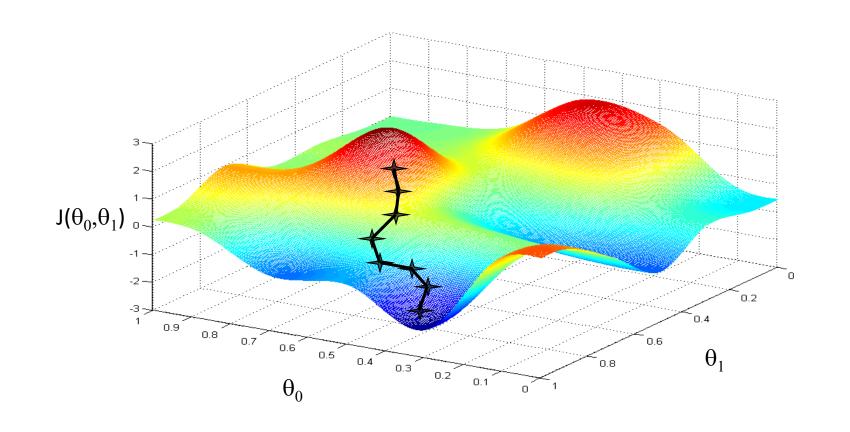

# Gradient descent

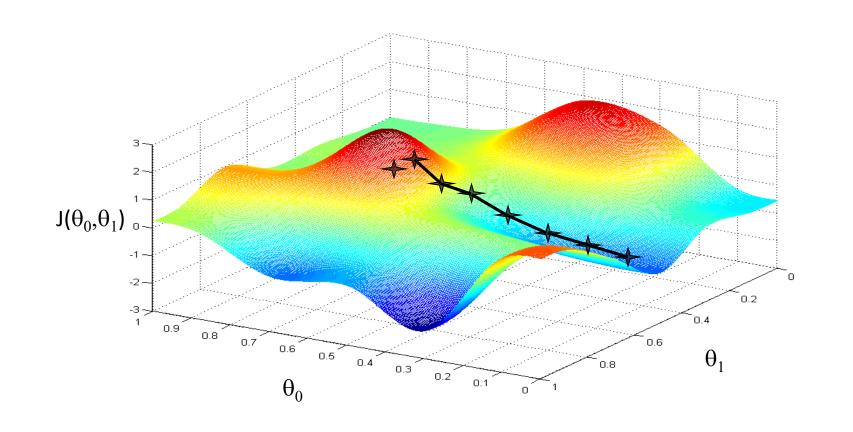

Have some function  $J(\theta_0, \theta_1)$ 

Want 
$$\min_{ heta_0, heta_1} J( heta_0, heta_1)$$

#### **Outline:**

- Start with some  $\theta_0, \theta_1$
- Keep changing  $heta_0, heta_1$  to reduce  $J( heta_0, heta_1)$  until we hopefully end up at a minimum

### **Gradient descent algorithm**

repeat until convergence { 
$$\theta_j := \theta_j - \bigcirc \frac{\partial}{\partial \theta_j} J(\theta_0, \theta_1) \quad \text{(for } j = 0 \text{ and } j = 1)$$
 } 
$$\text{learning rate}$$

#### Correct: Simultaneous update

$$temp0 := \theta_0 - \alpha \frac{\partial}{\partial \theta_0} J(\theta_0, \theta_1)$$

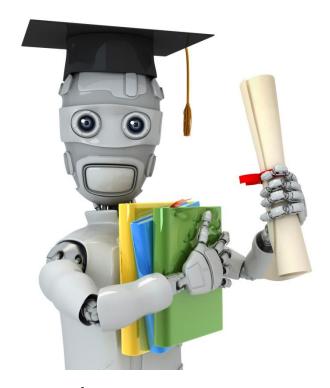

$$temp1 := \theta_1 - \alpha \frac{\partial}{\partial \theta_1} J(\theta_0, \theta_1)$$

$$\theta_0 := temp0$$

$$\theta_1 := temp1$$

#### Incorrect:

$$\begin{array}{l} \operatorname{temp0} := \theta_0 - \alpha \frac{\partial}{\partial \theta_0} J(\theta_0, \theta_1) \\ \theta_0 := \operatorname{temp0} \\ \operatorname{temp1} := \theta_1 - \alpha \frac{\partial}{\partial \theta_1} J(\theta_0, \theta_1) \\ \theta_1 := \operatorname{temp1} \end{array}$$

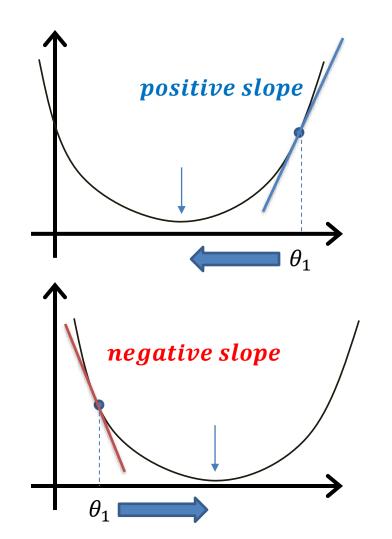

Machine Learning

# Linear regression with one variable

# Gradient descent intuition

## **Gradient descent algorithm**

```
repeat until convergence { \theta_j := \theta_j - \alpha \frac{\partial}{\partial \theta_j} J(\theta_0, \theta_1) \qquad \text{(simultaneously update } j = 0 \text{ and } j = 1) }
```

$$\theta_{1} := \theta_{1} - \alpha \frac{\partial}{\partial \theta_{1}} J(\theta_{1})$$

$$suppose: \frac{\partial}{\partial \theta_{1}} J(\theta_{1}) > 0$$

$$\theta_{1} := \theta_{1} - \alpha * (positive number)$$

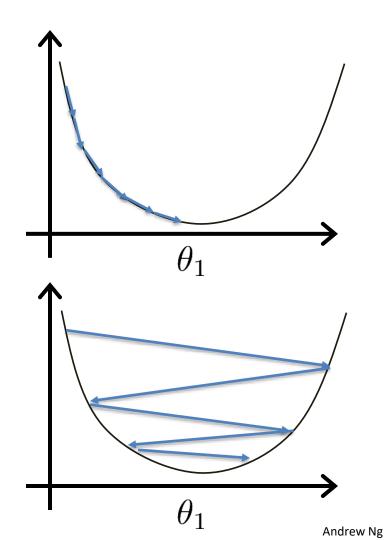

$$\begin{aligned} \theta_1 &:= \theta_1 - \alpha \frac{\partial}{\partial \theta_1} J(\theta_1) \\ &suppose \colon \ \frac{\partial}{\partial \theta_1} J(\theta_1) < 0 \end{aligned}$$

 $\theta_1$ : =  $\theta_1 - \alpha * (negative number)$ 

$$\theta_1 := \theta_1 - \alpha \frac{\partial}{\partial \theta_1} J(\theta_1)$$

If  $\alpha$  is too small, gradient descent can be slow.

If  $\alpha$  is too large, gradient descent can overshoot the minimum. It may fail to converge, or even diverge.

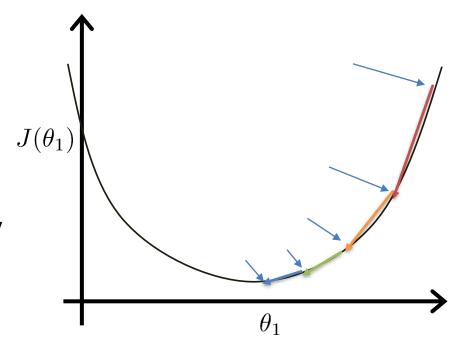

#### Current value of $\theta_1$

- A. Leave  $\theta_1$  unchanged
- B. Change  $\theta_1$  in a random direction
- C. Move  $\theta_1$  in the direction of the global minimum of J( $\theta_1$ )
- D. Decrease  $\theta_1$

Gradient descent can converge to a local minimum, even with the learning rate  $\alpha$  fixed.

$$\theta_1 := \theta_1 - \alpha \frac{d}{d\theta_1} J(\theta_1)$$

As we approach a local minimum, gradient descent will automatically take smaller steps. So, no need to decrease  $\alpha$  over time.

Machine Learning

# Linear regression with one variable

Gradient descent for linear regression

## Gradient descent algorithm

repeat until convergence {  $\theta_j := \theta_j - \alpha \frac{\partial}{\partial \theta_j} J(\theta_0, \theta_1)$  (for j = 1 and j = 0)

## **Linear Regression Model**

$$h_{\theta}(x) = \theta_0 + \theta_1 x$$

$$J(\theta_0, \theta_1) = \frac{1}{2m} \sum_{i=1}^{m} \left( h_{\theta}(x^{(i)}) - y^{(i)} \right)^2$$

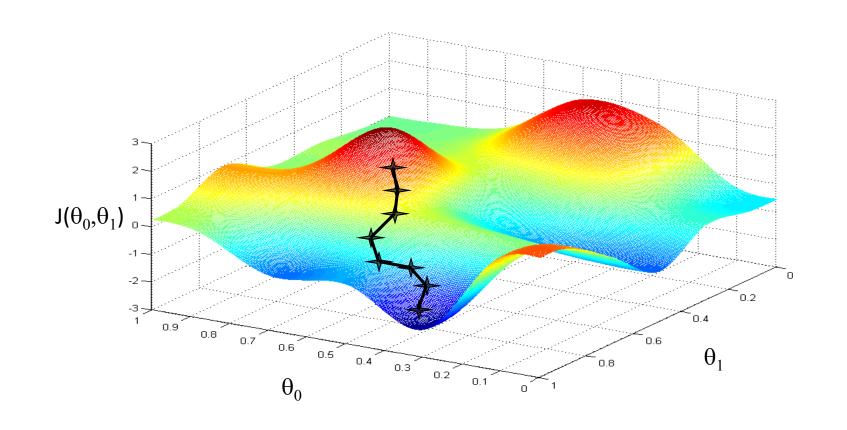

$$\frac{\partial}{\partial \theta_j} J(\theta_0, \theta_1) = \frac{\partial}{\partial \theta_j} \frac{1}{2m} \sum_{i=1}^m \left( h_{\theta}(x^{(i)}) - y^{(i)} \right)^2$$

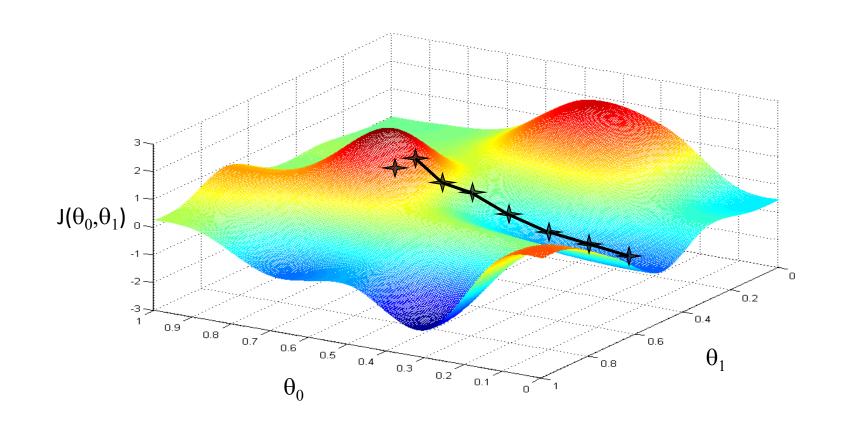

$$= \frac{\partial}{\partial \theta_j} \frac{1}{2m} \sum_{i=1}^m \left( \theta_0 + \theta_1 x^{(i)} - y^{(i)} \right)^2$$

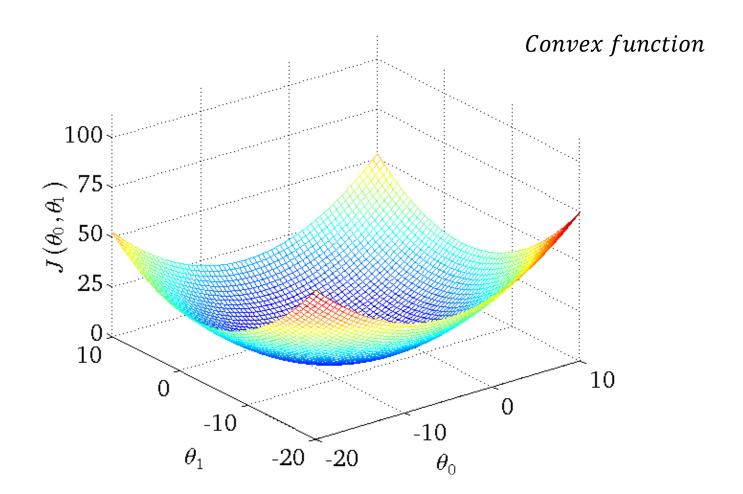

$$j = 0 : \frac{\partial}{\partial \theta_0} J(\theta_0, \theta_1) = \frac{1}{m} \sum_{i=1}^{m} (h_{\theta}(x^{(i)}) - y^{(i)})$$
$$j = 1 : \frac{\partial}{\partial \theta_1} J(\theta_0, \theta_1) = \frac{1}{m} \sum_{i=1}^{m} ((h_{\theta}(x^{(i)}) - y^{(i)}) \cdot x^{(i)})$$

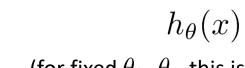

## **Gradient descent algorithm**

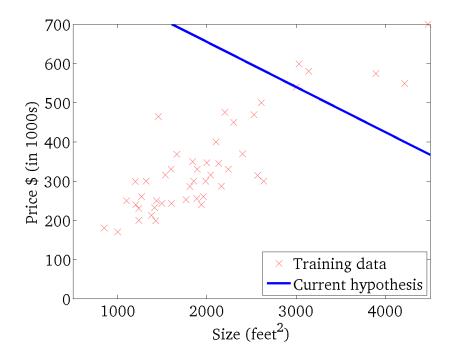

repeat until convergence {  $\theta_0 := \theta_0 - \alpha \frac{1}{m} \sum_{i=1}^m \left( h_\theta(x^{(i)}) - y^{(i)} \right) \quad \text{update} \\ \theta_0 := \theta_1 - \alpha \frac{1}{m} \sum_{i=1}^m \left( h_\theta(x^{(i)}) - y^{(i)} \right) \cdot x^{(i)} \quad \text{simultaneously}$
